

ABSTRACT OF THE DISCLOSURE

A capsule (1) mounted in a stopper for a container which is essentially used to distribute liquids. The sealed capsule (1) essentially includes a deformable membrane (2) which is sealed at the base thereof by a piercable cap (3) defining a volume containing at least one substance and having at least one intermediate part (6) which is provided by a breaking elements (4) which is integrated into the cap (3) and which can break it in order to release an effective amount of substance (s) (S) further to sufficient deformation of the deformable membrane (2), the intermediate part (6) being embodied in the form of a peripheral ring (7) on which an arc-shaped element (15) rests, whereby the free end (16) of the element is embodied in the form of at least one protruding or pointed element (12) directed towards the cap (3) in order to achieve the breakage.
